Power Automate | How to Get More Than 100,000 Rows From a Dataverse Table

November 3rd, 2021

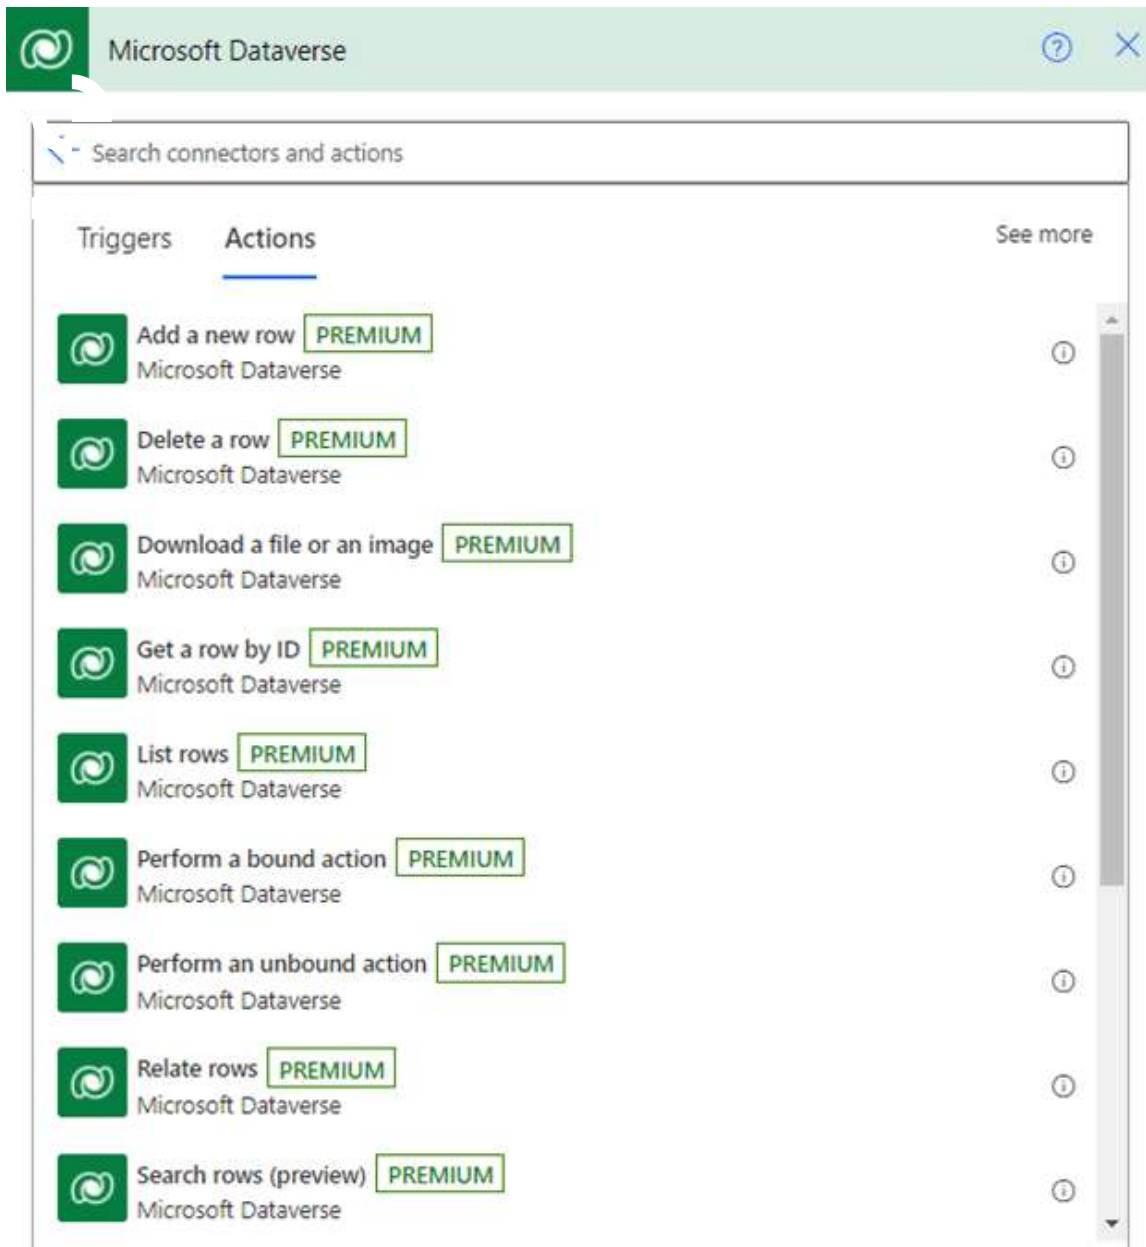

By [Justin Song](#), Senior BI Analyst

Did you know that the list rows action from the Dataverse connector in [Microsoft Power Automate](#) has a limit on the number of rows that can be returned? The Dataverse connector returns up to 5,000 rows by default. Follow the below instructions to see how to get more than 5,000 rows:

Suggested Articles:

Dynamics 365 CRM: Workflows
vs Power Automate vs Plugins
vs JavaScript vs Business

To get more than 5,000 rows, turn on the Pagination and set the threshold up to 100,000 in Settings:

Settings for 'List rows'

Pagination

Retrieve items to meet the specified threshold by following the continuation token. Due to connector's page size, the number returned may exceed the threshold.

Pagination ☒ On

Threshold

Threshold of items to return

The threshold should be a number greater than 0 and less than or equal to 100000.

Secure Inputs

Secure inputs of the operation.

Secure Inputs ☐ Off

Secure Outputs

Secure outputs of the operation and references of output properties.

Secure Outputs ☐ Off

Asynchronous Pattern

With the asynchronous pattern, if the remote server indicates that the request is accepted for processing with a 202 (Accepted) response, the Logic Apps engine will keep polling the URL specified in the response's location header until reaching a terminal state.

Asynchronous Pattern ☒ On

Automatic decompression

Automatically decompress gzip response.

Automatic decompression ☒ On

Timeout

Limit the maximum duration an asynchronous pattern may take. Note: this does not alter the request timeout of a single request.

Duration ⓘ

Example: P1D

Retry Policy

A retry policy applies to intermittent failures, characterized as HTTP status codes 408, 429, and 5xx, in addition to any connectivity exceptions. The default is an exponential interval policy set to retry 4 times.

Done

Cancel

What if you have more than 100,000 rows to process? Here's how you can get more than 100,000 rows from Dataverse table; use the skip token to send another request until the skip token returns empty.

1. Initialize variable

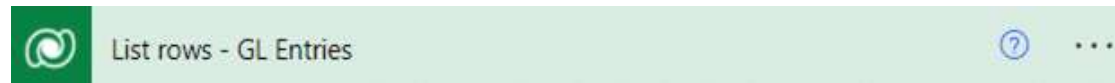

Initialize Skip Token

* Name: Skip Token

* Type: String

Value: Enter initial value

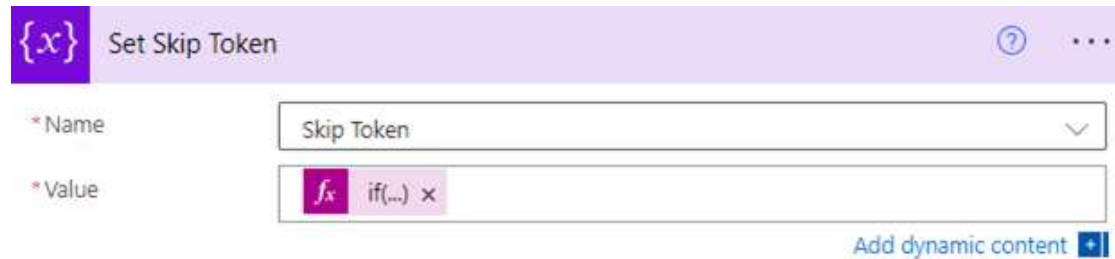

2. List rows action from Dataverse connector:

List rows - GL Entries

3. Set variable to skip token from **@odata.nextLink** value with the expression below.

You need to replace both 'List_rows_-_GL_Entries' with your name of List rows action:

Set Skip Token

* Name: Skip Token

* Value: if(...) x

Add dynamic content +

```
if  
(  
    empty  
    (  
        outputs('List_rows_-_GL_Entries')['body/@odata.nextLink']  
    ),  
    ''  
,
```

```

decodeUriComponent
(
  last
  (
    split
    (
      uriQuery(outputs('List_rows_-_GL_Entries')?
['body/@odata.nextLink']),
      'skiptoken='
    )
  )
)

```

4. Insert/run first 5,000 rows:

The screenshot shows a Power Automate workflow editor. At the top, there is a blue step bar labeled "Apply to each - GL Entries" with a refresh icon and a menu icon. Below it, a dropdown menu is open with the text "Select an output from previous steps" and a single option "value x" with a green eye icon. Below the dropdown is a red step bar labeled "Insert row (V2) - GL Entries" with a SQL icon, a help icon, and a menu icon. At the bottom, there is a blue button with a plus icon and the text "Add an action".

5. Add a condition if the variable is not empty:

6. Do this until the variable becomes empty for every 5,000 rows as a batch. Set the count to 5,000. Enter timeout. PT1H is one hour.

7. Use the variable on the skip token to get the next 5,000 rows:

List rows - GL Entries with Skip Token

*Table name: WIGL-GLEntriess

Select columns: Enter a comma-separated list of column unique names to limit which columns are returned

Filter rows: Enter an OData style filter expression to limit which rows are listed

Sort By: Enter an Odata style orderBy query to sort the rows

Expand Query: Enter an Odata style expand query to list related rows

Fetch Xml Query: Enter a Fetch XML query for advanced customization

Row count: Enter the number of rows to be listed (default = 5000)

Skip token: {x} Skip Token x

Partition ID: An option to specify the partitionId while retrieving data for NoSQL tables

[Hide advanced options](#)

8. Set next skip token from **@odata.nextLink** value to the variable with expression below. You need to replace both 'List_rows_-_GL_Entries_with_Skip_Token' with your name of List rows action (previous step):

{x} Set variable in Loop

*Name: Skip Token

*Value: {x} if(...) x

```
if
(
    empty
```

```

(
  outputs('List_rows_-_GL_Entries_with_Skip-Token')?
  'body/@odata.nextLink']
),
',
decodeURIComponent
(
  last
  (
    split
    (
      uriQuery(outputs('List_rows_-_
_GL_Entries_with_Skip-Token')?['body/@odata.nextLink']),
      'skiptoken='
    )
  )
)
)
)

```

9. Insert/run returned list of rows:

The screenshot shows a workflow editor interface. At the top, there is a blue bar with a refresh icon and the text "Apply to each". Below this is a dropdown menu with the text "Select an output from previous steps" and a green icon, showing "value x". Below the dropdown is a red bar with a SQL icon and the text "Insert row (V2)". At the bottom, there is a blue icon and the text "Add an action".
